

## Fortis EnableIt™

### Foster system interoperability with proven technology

Many organizations face the challenge of how to access the right information when it's needed. **Fortis EnableIt** is designed to alleviate this challenge by making business critical documents and information easy to access and share.

**Fortis EnableIt** expedites information collection and processing by delivering seamless image-enabling capabilities that integrate core business applications with document management software, without costly API programming or custom integration. It offers integration from host, Windows®-based and browser-based applications. The software can pass data from core business applications to and from **Fortis** document management software and other document management applications. **Fortis EnableIt** can scan, index and import documents; update index data from within a core business application; and facilitate many other integration techniques.

Providing a desktop integration platform, **Fortis EnableIt** exposes, accesses and integrates any object from any application with any other object in a quick, simple manner. Now you can connect objects between applications and add logic to form new automations, add new functionality to existing applications, or even build brand new composite applications that consist of functionality from multiple applications in a single unified view. The end result is dramatically improved productivity.

**Fortis EnableIt** interfaces directly with the objects within an application so that minor changes do not require any alterations to the integration. Some integration technologies use screen scraping, which is not scalable or stable, and requires object fields to remain in the same geographic location within an application to function properly. **Fortis EnableIt** does not use screen scraping.

With **Fortis EnableIt**, users can instantly retrieve documents and information in the **Fortis** repository right from their core business applications. Users simply identify data in the core business application, and **Fortis** displays the associated documents making them available for review. With critical documents being produced on demand, organizations can use this information to eliminate redundancy, deliver high-quality customer service, improve efficiency and enhance overall performance.

#### With Fortis EnableIt Your Organization Can:

- Seamlessly integrate **Fortis** with business critical applications
- Use state-of-the-art technology to rapidly deploy automations
- Leave current systems in place and easily connect application silos
- Achieve higher accuracy rates and save time by eliminating duplicate data entry
- Seamlessly integrate document management with business critical applications
- Realize more ROI from your existing technology investments
- Increase productivity by retrieving related documents without leaving the current application

## Efficiency gains, significant time savings

**Fortis EnableIt** improves the quality and effectiveness of healthcare activities by increasing productivity and optimizing business processes. Easy to learn and intuitive to use, **Fortis EnableIt** makes information retrieval quick and easy. For example, using **Fortis EnableIt**, an accounts payable department can scan invoices into **Fortis** and index them based on metadata from their accounting system. Once the invoice is archived into **Fortis**, it can be accessed from accounting based on invoice number and other specified fields. If a change is made in either system, the data can be synched automatically to eliminate duplicate data entry.

## Seamless image-integration capabilities

An innovative solution, **Fortis EnableIt** offers exceptional integration technologies supporting host applications, including Rumba, Hummingbird, Attachmate and other host emulation products, Windows-based applications, including CRM and ERP programs, Microsoft Office products and Web browser-based applications with Fortis document management software. With **Fortis EnableIt**, organizations can leverage information in their line-of-business applications, such as J.D. Edwards, SAP, Oracle Financials, Peoplesoft, and other AP applications.

## Robust automation

**Fortis EnableIt** delivers numerous integration options beyond traditional image-enabling capabilities so that your organization can maximize productivity. **Fortis EnableIt** lets users easily automate data exchange between core business applications and **Fortis**, scan and import

documents into **Fortis**, and update index data for **Fortis** documents. Often, a core business application and **Fortis** are separately maintained so that users have to perform duplicate data entry. With **Fortis EnableIt**, users can enter data in the core business application, capture this value, locate the corresponding document in **Fortis**, and update the **Fortis** index fields with the values from the core business application.

**Fortis EnableIt** also provides support for email, Web (http requests), FTP, data population, encryption/decryption, scripting, direct SQL statements, stored procedures, and integration with Microsoft Office.

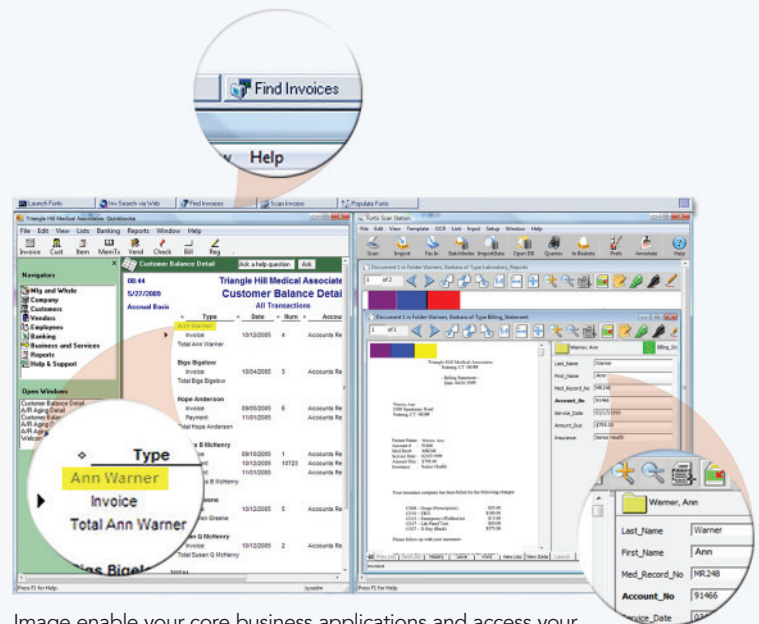

Image enable your core business applications and access your business critical documents with the touch of a button.
